- מן ספיט קרחת UV
- PROTECTS SURFACE AGAINST FUNGI AND MOULD
- QUICK DRYING
- PROTECTS AGAINST UV RAYS

**Water based,
translucent wood protection**

BONDEX EXTRA – NEW

BONDEX Extra is a water based, translucent wood protection, which prevents the growth of surface fungi and mould, and protects against the sun's UV-rays.

A translucent wood protection decorates your wooden surface beautifully, and leaves the wood grain visible through the coating.

We recommend that you use BONDEX Extra on facades, fences and carports. BONDEX Extra is not suitable for use on horizontal surfaces such as e.g. wooden decks.

You can apply BONDEX Extra by brush or spray and second coat can be applied after just 4 hours, which means that you can actually finish your work on 1 day!

BONDEX Extra can be tinted in many different shades – so you can get the exact colour you need! – Here you can see some examples:

668 Red Mahogany

722 Oak

725 Palisander

728 Oregon Pine

729 Teak

731 Nut Brown

800 White

900 Clear

Keep your wood healthy

Wood is a natural material, and when used in construction, it is exposed to natural decay from sun, wind, rain and snow 365 days a year.

To keep the wood looking beautiful, it is important to give your wood the right protection from the beginning.

BONDEX has more than 100 years' experience in wood protection, so you can trust us, when we say that in BONDEX, you will get World Class Wood Protection products, which will keep your wood protected and beautiful for many years.

Where wood protection is concerned, wood is not just wood!

- **All types of outdoor wood** are exposed to the elements and are impacted by UV-rays, damp, rain, snow and dirt.
- **Softwoods** – such as e.g. pine or spruce – are susceptible to attacks from blue stain
- **Hardwoods** – such as e.g. teak or oak – are naturally immune from blue stain as a rule
- **Factory-made pre-impregnated softwoods** have blue stain protection

So the first thing you should do, is to determine on which wood species, you want to apply wood protection, and if you need to use a preservative, before applying the final treatment.

A preservative is normally recommended for use on structural wood, framework timber, construction timber and timber frames. BONDEX Preserve II from BONDEX offers protection against:

- Mould
- Fungi
- Insects
- Termites

BONDEX Preserve II is both preventive and curative, and we would normally recommend use on softwoods and any other kinds of wood, which has already been attacked by any of the above.
